

## Dr. Tomas Marques-Bonet

*Institute of Evolutionary Biology*

*Icrea Research and Full Professor at University Pompeu Fabra*

*Dr. Aiguader 88, 08003, Barcelona, Spain*

tomas.marques@upf.edu

### Summary

Over the past 15 years, my study of primates has been foundational in advancing our understanding of human biology. Genomic insights from primates have significantly contributed to medical advancements and the field of evolutionary biology. In 2023, my lab achieved a major milestone by leading a Special Issue in *Science*, publishing the complete genomes of 50% of the world's primate species. This international effort underscored how mutations in primate genomes inform the functional consequences in humans. Additionally, in 2024, a co-led study on human noncoding genome regions was published in *Nature*, further enhancing our understanding of human biology. As an independent researcher, I led the first global study on great ape genome diversity, revealing the genetic distinctions between humans and apes (Prado-Martinez et al. *Nature* 2013; deManuel et al. *Science* 2016). My lab has also achieved breakthroughs, such as recovering the oldest ape genetic material and identifying unique introgression events in bonobos, which has implications for conservation and combating illegal trafficking (Welker et al. *Nature* 2019). In functional genomics, my team has explored molecular differences between humans and great apes, uncovering regulatory mechanisms and human-specific genomic features (Ferrandez et al. *Genome Research* 2022). Throughout my career, I have published over 200 peer-reviewed articles, with about a quarter appearing in high-impact journals (*Nature*, *Cell*, *Science*). I also hold a European patent and have secured prestigious funding, including ERC and NIH grants, and private conservation funding from Revive&Restore.

In service to the scientific community, I have held leadership roles, such as Director of the Institute of Evolutionary Biology and panelist for the European Research Council. Additionally, I founded the Cryozoo at the Barcelona Zoo, a cell bank for animal species. My mentorship includes training 23 PhD students and nine postdoctoral researchers, many of whom have advanced to prominent roles globally. Notably, I recently received the Premi Ciutat de Barcelona 2023. My career is driven by a commitment to interdisciplinary research, collaboration, and a vision to understand human biology through primate genomics.
